Unit – 3
Mixed Reality
End use-cases best suited for MR

End use-cases best suited for MR

- Mixed Reality (MR) combines real-world and virtual environments.
- Digital objects are anchored to and interact with the physical world.
- Users can see, interact, and manipulate holographic objects in real space.
- MR is widely used in training, design, healthcare, and collaboration.

Possible use cases

- Industrial Training & Maintenance
- Medical Training & Surgery
- Product Design & Prototyping
- Architecture & construction
- Education & Interactive Learning
- Remote Collaboration
- Retail & Product Visualization

Industrial Training & Maintenance

- Helps workers learn machine operation and repair.
- Provides step-by-step virtual instructions over real equipment.
- Reduces training time and errors.
- Improves safety in industrial environments.

Medical Training & Surgery

- Doctors can visualize 3D organs and anatomical structures.
- Helps surgeons plan complex surgeries.
- Medical students can practice procedures in a safe environment.
- Improves accuracy and understanding.

Product Design & Prototyping

- Engineers can interact with 3D product models in real space.
- Enables faster design testing and modifications.
- Reduces cost of building physical prototypes.
- Widely used in automotive and manufacturing industries.

Architecture & Construction

- Architects can visualize virtual buildings on real construction sites.
- Helps identify design errors before construction.
- Improves collaboration between architects and engineers.
- Enhances project planning and visualization.

Education & Interactive Learning

- Students can explore 3D models of planets, molecules, or historical artefacts.
- Makes learning more engaging and interactive.
- Improves understanding of complex subjects.
- Useful in science, engineering, and medical fields.

Remote Collaboration

- Teams in different locations can work on shared holographic models.
- Allows real-time discussion and interaction with 3D objects.
- Useful for engineering design and technical meetings.
- Improves productivity and teamwork.

Retail & Product Visualization

- Customers can see virtual products in real environments.
- Example: placing furniture in a room before buying.
- Helps customers make better purchase decisions.
- Enhances online and in-store shopping experience.

Thank You…!!!
